Teacher-Made Tests' Specificity and Sensitivity in Measuring Students' Academic Performance at Public Universities: Evidence from Ethiopia

Researcher: Tekalign Geleta Kenea (PhD)

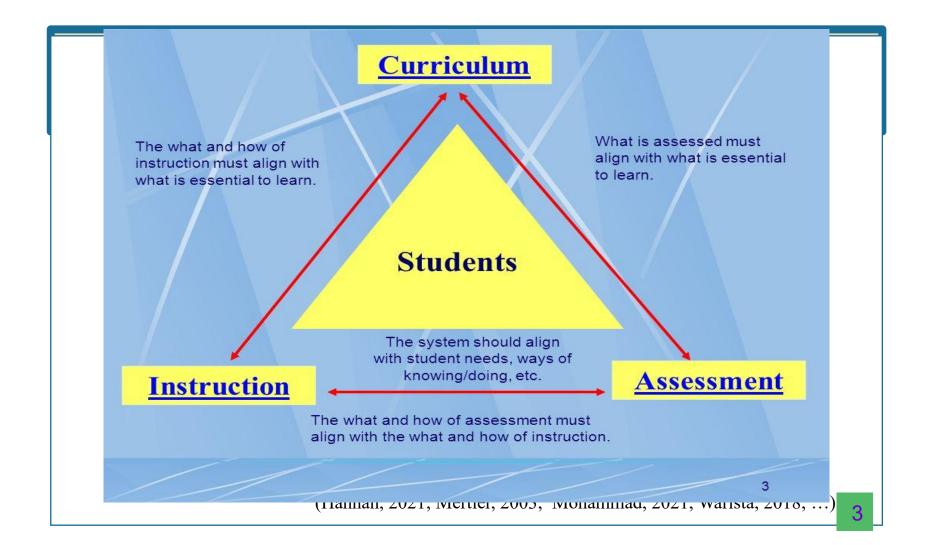

Skylight Hotel, Addis Ababa Ethiopia 25th-29th August 2025

Targets of the Presentation

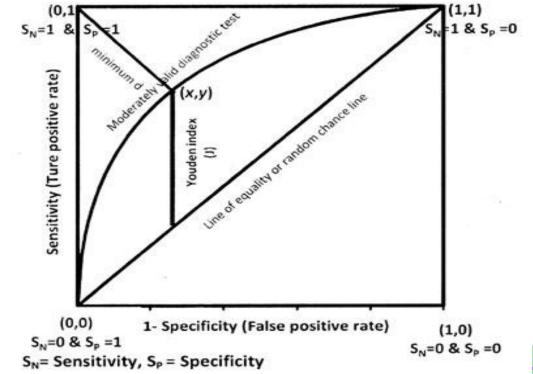

- Introduction
- Results & Discussion
- Conclusion

Introduction

If assessment matters, what matters in turn?

Measure's quality (Naumann, 2019; Polikoff,
 2010,...): specificity & sensitivity

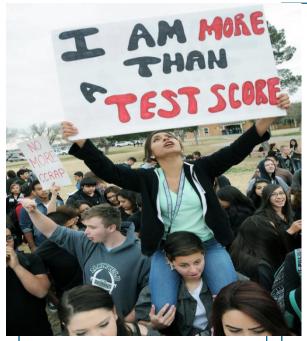

Issues frequently arise are:

(Brown, 2012; Eric, 2021; Lukmanul, 2020; Quansah, 2019; Singh, 2022...)

- teachers of all educational levels are criticized by:
 - the measurement assumptions
- 90% of HEIs TMTs are out of quality

(Berhanu, 2022; Brown, 2012; Campos, 2022; Chala, 2020; Edu.Road Map, 2018-2030; Mebratu, 2016; Singh, 2022; Tesfamariam, 2021)

- Globally: Tests resistance movements have emerged
- Locally, on Ethio HEIs measurement quality:
 - questions have been raised from parents,
 employers, and customers
- Indicators to suspect exams quality of Ethio HEIs:
 - 81.6% of stdts' are engaged in academic cheating
 - grade inflation
 - graduates' unemployment rate increased to 9.22 %

Attempts:

(Edu.Road Map, 2018-2030; Eyob, 2022; Metages, 2019)

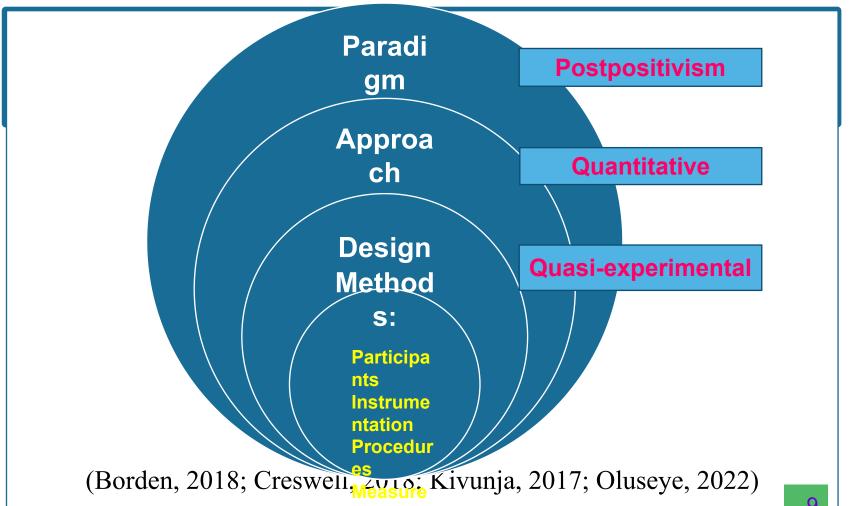

- Harmonizing HEI measurement
- Researches have been conducted
 - only on CA
- MoE has come with STs
 - but it is controversial

Research Question

- 1. What is the <u>specificity</u> of TMTs in measuring students' academic performance in public universities at **pre-instructional** intervention?
- 2. What differences were observed between public universities in the specificity and students' academic performance at **pre-instructional** intervention?
- 3. What are the instructional <u>sensitivities</u> of TMTs in measuring students' academic performance in public universities at **post-instructional** intervention?
- 4. What differences were observed between public universities in the instructional sensitivity of TMTs and students' academic performance at **post-instructional** intervention?

Methodology

Instructional Intervention

Intervention Group

Services:

Oral orientation & direction-giving in developing the test for the course & administering it

Instruction:

Offering course

Requesting that teachers follow the MoE's standardized curriculum, modular approach, & criterionreferenced assessment

Administering the exam for the second time

Comparison Groups

Services:

Oral orientation & direction-giving in developing the test for the course & administering it

Instruction:

Offering course

Administering the exam for the second time

Assessment

Specificity of TMTs

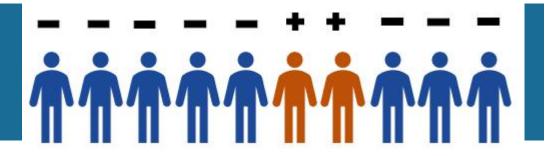

At baseline

Instructional SenSitivity
of TMTs: CVI, IC, P-level,
D-power, & PPDI

At endline

Key Findings

Pre- instruction

RQ1, Specificity (Using Bayes' theorem; Arif, 2015):

• .6 to .61<.7, a Type-I error range of .39 to .40

RQ2, Differences in specificity:

- In specificity: an $F_{2,77}$ =.163 at α =.849>.05,
- for the students' academic performance:
 - an $F_{2,219}$ =.146 at α =.865>.05,

*Consistent with Lemecha's (2020), Tesfamariam's (2021), Yizengaw's (2018) ... studies found graduates' GPAs & competence are mismatched

Key find...

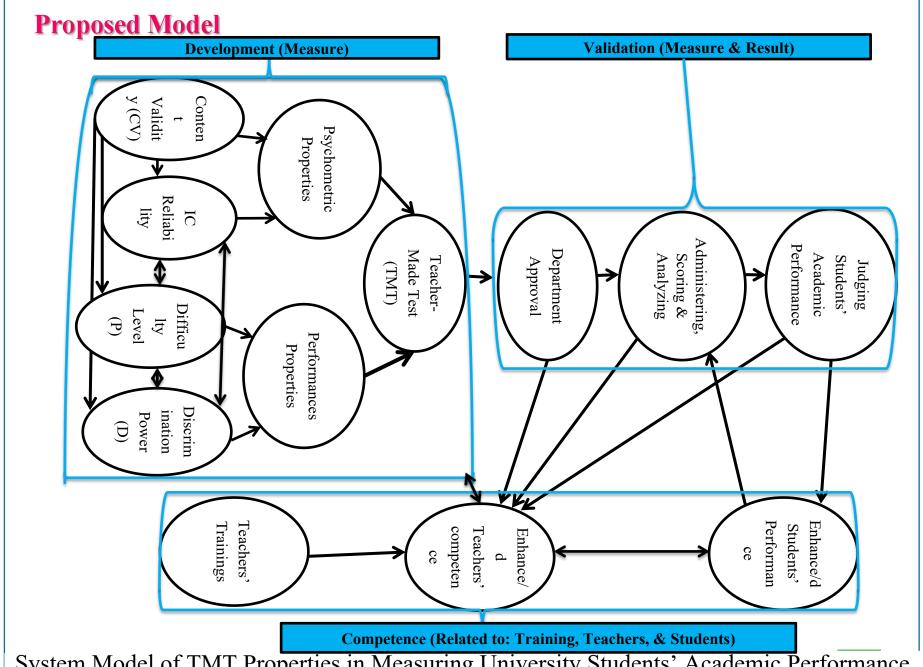

Post- instruction

RQ3, Sensitivity (using Omolola, 2018; Maria, 2012) from:

- PPDI was .07 < .2 for all universities
- psychometrics: CVI b/n .60 & .61<.83, IC is $\alpha = .59$ to .65 < .7
- performance: P ranges .45 .51, but < .6, D is .005
 to .06 < .2

RQ4, Differences: No significant d/f in sensitivity:

- for all parameters at $\alpha = .1$ to .983 > .05,
- academic perfo with at $\alpha = .872 > .05$
- *Consistent with local studies (Lemecha, 2020; Sewagegn, 2019...):
 - Saying Ethiopian HEIs measures are uniformly questionable in reflecting graduates actual competence

System Model of TMT Properties in Measuring University Students' Academic Performance

Conclusion

- Working measure violets the assumptions & unable to:
 - detect differences b/n students' surface & deep knowledge
 - reflect effects of curriculum & instruction
- Strength:
 - combining specificity & sensitivity
 - proposing new model
- Limitation:
 - not too strong intervention, needing further intervention
- For further research:
 - investigating reasons for teachers developing ineffective measures
